1-1 Trivial example for object-centric instrumentation 1

What we are talking about

In the next chapters, we evaluate each technique following a three-fold evaluation. First, the studied technique is applied on a simple example of object-centric instrumentation. Second, the technique is evaluated against a set of desirable properties. Finally, performance overhead are evaluated. Only the raw solution is evaluated, without considering the possibility of enhancing the technique by building something on top.

1.1 Illustration example

Each solution is experimented on a trivial example of object-centric behavior instrumentation. This example is illustrated in script 1-1. Two instances of `OrderedCollection` are created, and to each of these instances is sent the `add:` message with a string as a parameter. The instrumentation must happen in-between. We want to instrument the `col1` object, so that when the `add:` message is received, the size of the collection and the added object (passed as parameter) are printed in the Transcript.

Listing 1-1 Trivial example for object-centric instrumentation

```
|col1 col2|  
col1 := OrderedCollection new.  
col2 := OrderedCollection new.  
  
"...instrumentation must happen here..."  
  
col1 add: 'Hello World'.  
col2 add: 'Hello World'.
```

1.2 Evaluation criteria

Each solution is evaluated against the following desirable properties.

Property	Definition
Manipulated entity	The unit of instrumentation (<i>e.g.</i> a class, a Trait, an object...)
Reusability	The entity can be reused to instrument different objects
Flexibility	Instrumentation does not put constraint on the source code or in the coding style
Granularity	The level of at which behavior can be instrumented (<i>e.g.</i> method, AST...)
Integration	Instrumentation does not break system features

1.3 Performance overhead evaluation

- source code with instrumentation example
- describe the used method
- describe the limitations of the method
